

House:

A house is a structure or building designed for people to live in. It typically provides shelter, privacy, and a place for individuals or families to reside. Houses can vary in size, layout, architectural style, and construction materials based on cultural, geographical, and personal preferences. Houses often include various rooms, such as bedrooms, living areas, kitchens, bathrooms, and may have additional features like a backyard, garage, or outdoor spaces.

Housing:

Housing refers to the overall provision of dwellings or living accommodations for individuals or communities. It encompasses the broad concept of providing suitable and adequate housing options to meet the needs of a population. Housing can include various types of residential units, such as houses, apartments, condominiums, townhouses, and other forms of living spaces. Housing also involves considerations of affordability, accessibility, quality, and the availability of supporting infrastructure and amenities.

In summary, a house is an individual dwelling unit within a broader concept of housing, which encompasses the overall provision of living accommodations for individuals and communities.
